

AMENDMENTS TO THE ABSTRACT

Please insert the Abstract on a new page after page 20 of the Specification.

ABSTRACT

A voice recognition method includes: representing a vocabulary translated into a Markov network; decoding by means of a Viterbi algorithm; and pruning explored solutions. The vocabulary is described in a tree made up of arcs and of nodes, between which transcriptions are defined that describe phonetic units used by a language model. The Markov network is constructed dynamically at least in part by means of Markov sub-units.
